DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

The changes made to 35 U.S.C. 102(e) by the American Inventors Protection Act of 1999 (AIPA) and the Intellectual Property and High Technology Technical Amendments Act of 2002 do not apply when the reference is a U.S. patent resulting directly or indirectly from an international application filed before November 29, 2000. Therefore, the prior art date of the reference is determined under 35 U.S.C. 102(e) prior to the amendment by the AIPA (pre-AIPA 35 U.S.C. 102(e)).

Claims 1-24 are rejected under 35 U.S.C. 102(e) as being anticipated by Kalkunte (US 6,813,268), filed as IDS on 5/22/07.

As per claims 1, 6, 7, 11-13, 17, 18, and 22-24, Kalkunte teaches a background memory manager (BMM) for managing a memory (see Kalkunte col. 6, lines 26-30; col. 6, lines 50-52: CBP (LPM), a first storage system) in a data processing system, the BMM comprising: circuitry for transferring data structures to and from an outside device and to and from a memory; a memory state map associated with the memory; and a

Art Unit: 2182

communication link to a processor; characterized in that the BMM manages the memory, determining if each data structure fits into the memory (see Kalkunte col. 6, lines 43-50: GBP (Global memory Buffer Pool, EPM), deciding exactly where to place each data structure in memory, performing all data transfers between the outside device and the memory, (see Kalkunte col. 15, lines 12-58; col. 34, lines 18-29; col. 15, lines 5-11 ; col. 15, lines 44-46: criteria for packet storage in CBP (LPM) or GBP (EPM), determination whether packets are stored within CBP (LPM) or GBP (EPM)) if a given packet is can fit within the LPM) and maintaining the memory state map ; (see Kalkunte col.15, lines 44-46: storage within GBP) according to memory transactions made, and informing the processor of new data and its location. (see Kalkunte col. 33, lines 26-37; col. 6, lines 50-52; col. 15, lines 5-11 ; col. 15, lines 35-46: Direct Memory Address (DMA) provides direct addresses for memory access, PMMU interfaces second storage system, determination whether packets can fit into GBP (EPM))

As per claims 2-4. 8-10, 14-16, and 19-21, Kalkunte teaches storing a given data structure, provides a data identifier for the given data structure on the link to the processor and making memory transactions, (see Kalkunte col. 6, lines 26-30; col. 6, lines 32-34: CBP (LPM), network switch local packet memory utilizing buffers (pre-configured memory units) updates the memory state map to a new memory state, keeping track of regions occupied by valid data and regions not occupied by valid data. . (see Kalkunte col. 15, lines 59-63; col. 20, lines 36-38; col. 20, lines 42- 46: system configured to drop packet and send updates about dropped packets)
